Jongkind C. C. H. 2008. — Two new species of *Hypselodelphys* (Marantaceae) from West Africa. *Adansonia*, sér. 3, 30 (1): 57–62.

## ABSTRACT

*Hypselodelphys triangularis* Jongkind and *Hypselodelphys velutina* Jongkind, two new species from the forests of West Africa, are described and illustrated. *Hypselodelphys triangularis* is characterized by its acute triangular fruits and c. 5 mm long inflorescence internodes. *Hypselodelphys violacea* (Ridl.) Milne-Redh., the only other *Hypselodelphys* species with acute triangular fruits in the area where *H. triangularis* is found, has inflorescence internodes about twice as long. The second new species, *H. velutina*, is characterized by its completely velutinous inflorescence internodes and rounded lobed fruits. *Hypselodelphys poggeana* (K.Schum.) Milne-Redh., the only species with comparable fruits in the same area, has an inflorescence with a distinctly different indumentum.

KEY WORDS  
Marantaceae,

new species.

## RÉSUMÉ

Deux nouvelles espèces d'*Hypselodelphys* (Marantaceae) d'Afrique de l'Ouest. *Hypselodelphys triangularis* Jongkind et *Hypselodelphys velutina* Jongkind, deux nouvelles espèces d'Afrique de l'Ouest, sont décrites et illustrées. *Hypselodelphys triangularis* est caractérisé par ses fruits triangulaires aigus et ses entreœuds inflorescentiels longs d'environ 5 mm. *Hypselodelphys violacea* (Ridl.) Milne-Redh., espèce sympatrique présentant le même type de fruits, en diffère par ses entreœuds deux fois plus longs. L'autre espèce, *H. velutina*, est caractérisée par ses entreœuds inflorescentiels complètement veloutés et ses fruits arrondis et lobés. Elle se distingue de l'espèce sympatrique *H. poggeana* (K.Schum.) Milne-Redh., par son trichome complètement différent.

MOTS CLÉS

espèce nouvelle.

## INTRODUCTION

When going through the literature and the herbarium collections from West Africa preparing the *Woody Plants of Western African Forests* (Hawthorne & Jongkind 2006), a guide to all woody plants of Upper Guinea, we came across several not yet published new species. The climbing Marantaceae species described here are two of them. Both have the, for the genus *Hypselodelphys* characteristic, bamboo-like and often zigzagging branches and the distinct interruption between the petiole and the midrib on the lower side of the leaf. *Hypselodelphys triangularis* is characterized by its acute triangular fruits and short inflorescence internodes. *Hypselodelphys violacea* (Ridl.) Milne-Redh., the only other *Hypselodelphys* species with acute triangular fruits in the area where *H. triangularis* is found, has inflorescence internodes about twice as long. *Hypselodelphys violacea* is the most common of the two species (see Fig. 1). The second new species, *H. velutina*, is characterized by its short and completely velutinous inflorescence internodes and rounded lobed fruits. *Hypselodelphys poggeana* (K.Schum.) Milne-Redh., the only species with comparable fruits in the same area, has an inflorescence with a distinctly different indumentum. Two specimens representing *H. velutina* in this publication are in the Flora of West Tropical Africa cited as *H. poggeana* (Hepper 1968: 88, 89). The only specimen of *H. scandens* Louis & Mullend. cited for Upper Guinea in the Flora of West Tropical Africa, *de Wit* 9150, is included here in *H. velutina* as well. No specimens of the real *H. scandens* from west of Nigeria have been found in the herbaria of Brussels, Kew, Paris and Wageningen. *Hypselodelphys scandens* is a much more robust plant than the two new species with inflorescences with c. 1 cm long internodes. A key to the western African species of *Hypselodelphys*, including the here published new species, can be found in Hawthorne & Jongkind (2006: 886, 887).

The flowers of *Hypselodelphys* are very difficult to study on herbarium specimens. If there are small differences in the shape of the flowers between the species of the genus than they were not found during this study. It is likely that there are differences in the colour of the flowers between the species (see Figs 1 and 5) but more field observations are needed

because most herbarium specimens do not show that colour anymore and we do not know enough about the colour variation within the species.

The leaves on the sterile shoots of *Hypselodelphys* species are usually much larger than those on the flowering branches, because of this the sizes of the leaves in the descriptions, that are mostly based on flowering and fruiting herbarium specimens, are likely to be an underestimation.

Photographs of the flowers of two species of *Hypselodelphys* were made short before this manuscript was published.

## SYSTEMATICS

### *Hypselodelphys triangularis* Jongkind, sp. nov. (Fig. 2)

*A Hypselodelphyde violacea* (Ridl.) Milne-Redh. *diffrer* *internodiis inflorescentiae aliquantum brevioribus et costa* *folii subtus glabra praeter basim.*

**TYPUS.** — Côte d'Ivoire. 24 km W of Sassandra, 31.X.1968, Breteler 5876 (holo-, WAG; iso-, B, BR, C, MO, P, US).

**PARATYPES.** — Liberia. Tapeta, Blepie road, few miles SW of town, 12.I.1967, Bos 2713 (WAG). — Road Tappita-Tchien, 21.I.1964, van Harten 254 (WAG).

Togo. Danyi Plateau, between Dzogbégan and Bago, 15.II.1978, Ern 3153 (K).

## DESCRIPTION

Small liana scrambling up to 5 m high in vegetation. Leaves slightly asymmetric; blade very variable in size, 3.5–12.5 × 2–4 cm, with some hairs at the base

FIG. 1. — *Hypselodelphys violacea* (Ridl.) Milne-Redh., flowers. Jongkind 8029.

below otherwise glabrous. Inflorescence terminal, simple or branched at base, up to 17 cm long, with internodes c. 5 mm long with the surface still easily visible through the indumentum of half-erect short hairs; bracts c. 2 cm long. Flower white with pink or violet, equal to the flowers of the other species in the genus. Fruit yellow and green, strongly acute three-lobed, flattened, muricate, 4 cm wide, with 3 large seeds.

#### HABITAT AND DISTRIBUTION

Regrowth in wet evergreen forest from Liberia to Togo (Fig. 3).

#### *Hypselodelphys velutina* Jongkind, sp. nov. (Figs 4; 5)

J.W.A. Jansen 1542 (MO, WAG). — E slope of Putu Hills East Range, W of Tiama Town, 31.V.2005, Jongkind, Kwewon & Kpadeyeh 6544 (WAG). Côte d'Ivoire. Mount Tonkoui, 9.II.1961, H.C.D. de Wit 9150 (WAG). — Mount Tonkoui, 30.III.2000, Jongkind, Hawthorne & Assi-Yapo 4839 (WAG).

#### DESCRIPTION

Liana scrambling up to 10 m high in vegetation. Leaves slightly asymmetric; blade very variable in size, 2.2-11 × 5-25 cm, with some hairs close to the midrib beneath but otherwise glabrous. Inflorescence terminal, simple or branched at base, up to 12 cm long, with internodes c. 5 mm long with the surface hiding beneath a dense cover of half-erect short hairs; bracts 1.7-2 cm long, dense velutinous on the outside. Flower white, sometimes with yellow and violet,

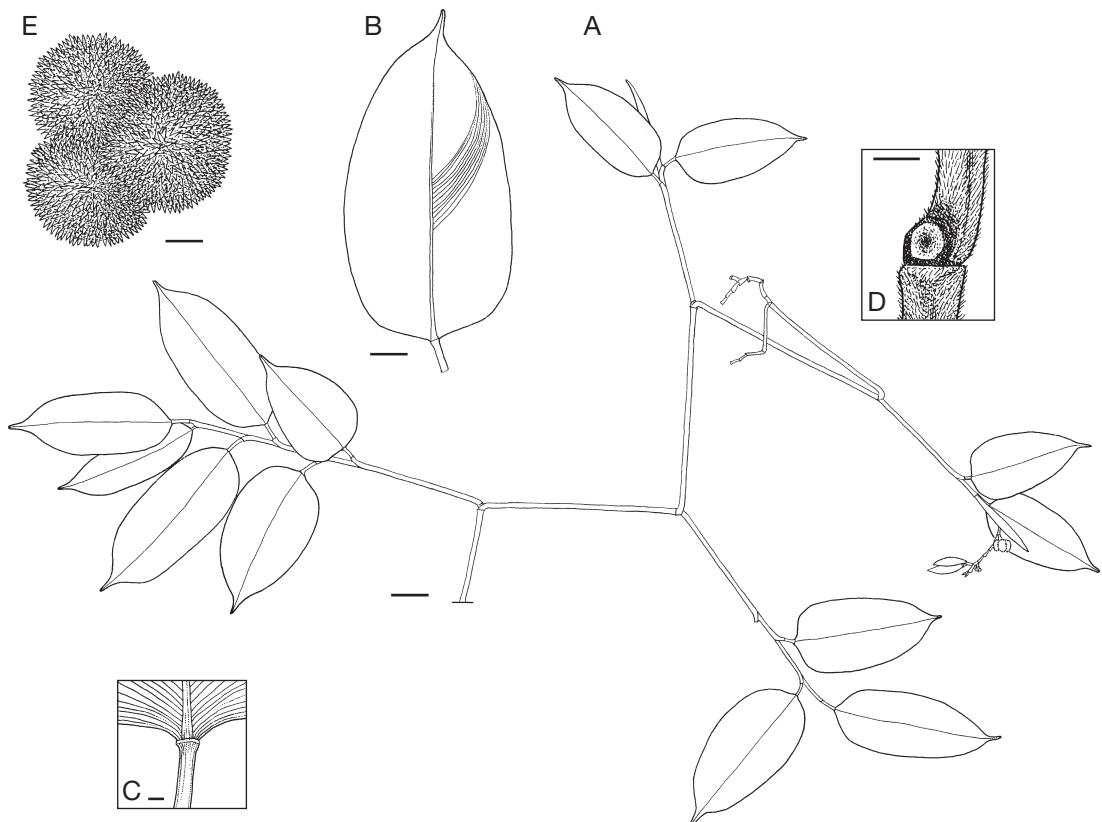

FIG. 4. — *Hypselodelphys velutina* Jongkind: A, habit, with all leaves on short shoots; B, leaf; C, leaf base from beneath; D, detail of inflorescence branch; E, fruit from beneath. A-D, Bos 2304; E, J.W.A. Jansen 1846. Scale bars: A, 2 cm; B, 1 cm; C, D, 1 mm; E, 5 mm.

FIG. 5. — *Hypselodelphys velutina* Jongkind: A, fruit; B, flowers. Jongkind 8024.

more or less equal to the flowers of the other species in the genus. Fruit yellow and green, three-lobed with rounded corners, muricate, with 3 large seeds.

#### HABITAT AND DISTRIBUTION

Wet evergreen forest from Sierra Leone to Côte d'Ivoire (Fig. 3).

#### REMARKS

The habit of *Hypselodelphys triangularis* is principally the same as that of *H. velutina* as shown in the Figure 4.

#### Acknowledgements

We are grateful for Marjolein Spitteler for preparing the illustrations and Roel Lemmens is thanked for the latin diagnosis.
