(Received 04 December 2009, accepted 4 March 2010)

Abstract – Investigation on the bryophyte flora of SE Europe has intensified during the past decade. However, in view of many new species recorded in this region lately, it can be assumed that a lot of work still needs to be done to reach the level of knowledge of the bryophyte flora within western European countries. In this paper the novelties recorded for some SE European countries are presented: two new records for Slovenia (*Bryum neodamense* and *Fossombronia foveolata*), three for Serbia (*Oxymitra incrassata*, *Riccia ciliifera* and *R. nigrella*) and one for Bosnia-Herzegovina (*Sphagnum teres*).

Bryophytes / flora / mosses / liverworts / new records / SE Europe

Résumé – Les recherches sur la flore bryophytique dans le Sud-Est de l'Europe se sont intensifiées durant la dernière décennie. Pourtant, selon le nombre de nouvelles espèces enregistrées dans cette région, on peut déduire que beaucoup de travail reste à faire pour atteindre le niveau de connaissance de la bryoflore des pays de l'Europe occidentale. Dans ce travail, les nouveautés enregistrées dans certains des pays de l'Europe sud-orientale sont présentées : deux nouveaux reports pour la Slovénie (*Bryum neodamense* et *Fossombronia foveolata*), trois pour la Serbie (*Oxymitra incrassata*, *Riccia ciliifera* et *R. nigrella*) et un pour la Bosnie-Herzegovina (*Sphagnum teres*).

Bryophytes / flore / mousses / hépatiques / nouveaux reports / SE Europe

INTRODUCTION

It is generally accepted that the bryophyte flora of the SE Europe is rather poorly known compared to other European regions. Very few professional or amateur bryologists have been active within the region. During the past decade the situations has slightly changed. There are more local people interested in bryophytes and the interest of foreign researchers has increased. This has resulted

* Corresponding author: marko@bio.bg.ac.rs

in many bryophyte novelties recorded for the region of SE Europe and individual territories within it.

For example, Sabovljević & Stevanović (1999) listed 423 mosses and Sabovljević (2000) listed 78 hepatic species for Serbia. Some years later, the check-lists of Sabovljević *et al.* (2008a) and Sabovljević & Natcheva (2006) listed 555 mosses and 118 hepatics respectively in Serbia. Similarly, the number of species per country has increased, but unevenly, depending on the intensity of research in the individual territories. Although the check-lists for the SE Europe (Sabovljević & Natcheva, 2006, partly updated for Mediterranean countries by Ros *et al.* (2007); Sabovljević *et al.*, 2008a) are quite recent, further new records have been added subsequently and updates of the lists are needed in the light of newly published papers (e. g. Blockeel *et al.*, 2007, 2008, 2009a, b, c; Erzberger *et al.*, 2008; Hajakova *et al.*, 2007; Özdemir & Uyar, 2008; Papp & Erzberger, 2007a, b; Papp *et al.*, 2008; Sabovljević *et al.*, 2008b; Kirmaci *et al.*, 2009)

MATERIAL AND METHODS

New records for three countries in SE Europe (Bosnia-Herzegovina, Serbia and Slovenia) were made during the study of bryophyte collections from the Balkans deposited in Budapest Natural History Museum (BP). The collections were made by various botanists and deposited in the bryophyte herbarium, named or not, and separate or mixed with other mosses, and they had not been previously published. Therefore, these newly verified old records were not considered for the relevant regions in the recent regional and national checklists. Nomenclature follows Grolle & Long (2000) for hepatics and Hill *et al.* (2006) for mosses.

RESULTS AND DISCUSSION

Three mosses and 3 liverworts species new to national bryophyte floras are listed.

Bryum neodamense Itzigs. (BP 41271)

Slovenia: Sphagnum mire at Ljubljana opposite to Udik. J. Breidler, 1884, rev. J. Podpera, conf. B. Papp. Endangered subarctic element (Düll, 1985) included in the rare (R) category in the Red Data Book of European Bryophytes (ECCB 1995). In SE Europe it is known from Bulgaria, Croatia, Romania and Serbia (Sabovljević *et al.*, 2008).

Fossombronia foveolata Lindb. (BP 27882/H).

Slovenia: Schischka forest at Ljubljana, on mud among *Carex*. C. Loitlesberger, 09 and 10.1917. In SE Europe this northern subatlantic species was known only from Greece (Sabovljević & Natcheva, 2006).

Oxymitra incrassata (Brotero) Sergio et Sim-Sim (BP 29454/H) (mixed with *R. nigrella*)

Serbia: Bács-Bodrog County (serb. Baćka). Saline grassland of Bátka at Senta. J. Guelmino, 11.1972, This sub-Mediterranean species has been recorded from

several SE-European countries, Albania, Bulgaria, Croatia, Greece, Montenegro and Romania (Sabovljević & Natcheva, 2006).

Riccia ciliifera Link ex Lindenb. (BP 29457/H)

Serbia: Bács-Bodrog County (serb. Bačka). Saline grassland of Bátka at Senta. *J. Guelmino*, 11.1972. This sub-Mediterranean, sub-Atlantic species has been reported from almost all SE-European countries except Montenegro, Serbia, Slovenia and the European part of Turkey (Sabovljević & Natcheva, 2006).

Riccia nigrella DC. (BP 29454/H) (mixed with *O. incrassata*)

Serbia: Bács-Bodrog County (serb. Bačka). Saline grassland of Bátka at Senta. *J. Guelmino*, 11.1972. This Atlantic, Mediterranean species is also known from almost all SE-European countries except Macedonia, Romania, Serbia, Slovenia (Sabovljević & Natcheva, 2006).

Sphagnum teres (Schimp.) Aongstr. (9045/S)

Bosnia-Herzegovina: Mt. Vranica, wet place in a spruce forest at lake Suho jezero. *A. Rusinska*, 10.06.1979. According to the checklist of the mosses of South-Eastern Europe (Sabovljević *et al.*, 2008), it had been reported from several Balkan countries (Bulgaria, Greece, Macedonia, Romania, Serbia and Slovenia), but not in Bosnia-Herzegovina.
